(*) Difference between Pivot Table and Power Pivot :-

Pivot Table	Power Pivot
> Summarizes & analyzes data.	> Helps manage & connect multiple tables for analysis.
> Can work with a single table / multiple related tables through the data model.	> Provides tools for relationships, calculations and data modeling.
> Can show total revenue, average sales & order count.	> Can calculate these & more across related tables using measures & DAX.
> Best for summarizing data quickly.	> Especially useful for more advanced analysis with multiple tables.

(*) NOTE: Power Pivot and Pivot Tables are not the same thing.
Power Pivot helps prepare and connect your data.
Pivot Table helps you summarize & ~~prof~~ present the results.
And It always use String that is categorical columns to connect not numerical columns.
ETL Tool → Extract, Transform, Load.

(*) Steps to Use Power Pivot in Excel :-

1. Prepare your data as Excel Tables ⇒
   - Open the worksheet containing your Orders data.
   - Select any cell inside the data.
   - Press Ctrl + T.
   - Tick My table has headers.
   - Click OK.

   To change a table name, select the table & open "Table Design → Table Name".

2. Add the tables to the Data Model ⇒
   The Data Model is the place where Excel stores tables that can be connected for analysis.
   For Each Table :
   (1) Select any cell inside the table.
   (2) Open the Power Pivot tab / use the Data tab if your Excel version provides the relevant option.
   (3) Select Add to Data Model.
   (4) Repeat for the other tables.

   If you don't see the Power Pivot tab, you may need to enable the add-in through File → Options → Add-ins → COM Add-ins → Go, then tick Microsoft Power Pivot for Excel if available.

3. Create relationships between Tables =>
This is one of the most important steps.
- Open the Power Pivot tab.
- Click Manage to open the Power Pivot window.
- Switch to Diagram View.
- Connect the columns of one Table to another table.

(*) Why Create a relationship?
Without a relationship, Excel may not know how to combine a Customer's name with the revenue or orders stored in the Orders table for example.

4. Create a Pivot Table from the Data Model =>
- Go to Insert → Pivot Table.
- Choose the option to use the workbook's Data Model or This Workbook's Data Model, depending on excel version.
- Choose where you want the Pivot Table to appear.
- Click OK.

5. Drag the fields into the Correct Areas.
