

(*) NESTED IF :- A Nested IF is an IF function used inside another IF function to check multiple conditions.

Syntax : IF(condition1, value-if-true, IF(condition2, value-if-true, value-if-false))

Example : If marks are 90 or above $\rightarrow$ A, 75 or above $\rightarrow$ B, 50 or above $\rightarrow$ C, otherwise $\rightarrow$ Fail.
 $= \text{IF}(A2 \geq 90, "A", \text{IF}(A2 \geq 75, "B", \text{IF}(A2 \geq 50, "C", "FAIL"))))$

(*) GROSS Salary :- It is the total salary before deductions such as PF, tax, insurance, etc.
formula : $= \text{Basic Salary} + \text{HRA} + \text{DA} + \text{PF} + \text{TA} + \text{Incentives} + \text{Bonus}$

Example : Basic = 24,000 ₹, HRA = 5,000, DA = 3,000
PF = 1,800, TA = 4,000, Incentives = 5,000,
Bonus = 3,000

Gross salary :- $= 24,000 + 5,000 + 3,000 + 5,000 + 1,800 + 4,000 + 5,000 + 3,000$

$$\boxed{GS = 50,800}$$

(*) NET Salary:- It is the amount an employee receives after deductions.

Formula: $= \text{Gross Salary} - \text{Total deductions}$

Example: Gross salary = 50,800, PF = 2000,

Tax = 1000, other deductions = 500

$$= 50800 - (2000 + 1000 + 500)$$

$$= 47,300 //$$

★ FINANCIAL FUNCTIONS :-

(*) FV (Future Value) $\Rightarrow$ Calculates the future value of an investment/loan based on a constant interest rate and payments.

Syntax: $= \text{FV}(\text{rate}, \text{nper}, \text{pmt}, [\text{pv}], [\text{type}])$

Example: $= \text{FV}(8\% / 12, 60, -5000, 0)$

(*) PV (Present Value) $\Rightarrow$ Calculates the Present Value of an investment or loan.

Syntax: $= \text{PV}(\text{rate}, \text{nper}, \text{pmt}, [\text{fv}], [\text{type}])$

Example: $= \text{PV}(8\% / 12, 60, -5000)$.

(*) RATE $\Rightarrow$ Calculates the interest rate per period for a loan or investment.

Syntax: $= \text{RATE}(\text{nper}, \text{pmt}, \text{pv}, [\text{fv}], [\text{type}], [\text{guess}])$

Example: $= \text{RATE}(60, -5000, 250000) * 12$.

(*) NPER $\Rightarrow$ Calculates the number of periods periods required for an investment/loan.

Syntax: $= \text{NPER}(\text{rate}, \text{pmt}, \text{pv}, [\text{fv}], [\text{type}])$

Example: $= \text{NPER}(8\% / 12, -5000, 25000)$.

(*) PER $\Rightarrow$ PER is not a standard Excel financial function. Usually, NPER is used when you want the number of payment periods.

(*) PMT $\Rightarrow$ Calculates the regular payment for a loan or investment.

~~=PMT~~

Syntax: $=PMT(\text{rate}, \text{nper}, \text{pv}, [\text{fv}], [\text{type}])$.

Example: $=PMT(8\%/12, 60, 250000)$.

(*) PPMT $\Rightarrow$ Calculates the principal portion of a payment for a specific period.

Syntax: $=PPMT(\text{rate}, \text{per}, \text{nper}, \text{pv}, [\text{fv}], [\text{type}])$

Example: $=PPMT(8\%/12, 1, 60, 250000)$

(*) IPMT $\Rightarrow$ Calculates the interest portion of a payment for a specific period.

Syntax: $=IPMT(\text{rate}, \text{per}, \text{nper}, \text{pv}, [\text{fv}], [\text{type}])$

Example: $=IPMT(8\%/12, 1, 60, 250000)$
