(4.) XLOOKUP Function:- It is an advanced lookup function in Microsoft Excel used to search for a particular value in a row or column and return the corresponding value from another row or column.
It is more flexible than VLOOKUP and HLOOKUP because it can search in both directions & can return results from columns on either side of the lookup column.

(*) Syntax: =XLOOKUP (lookup_value, lookup_array, return_array, [if_not_found], [match_mode], [search_mode])
lookup_value → The value you want to find.
lookup_array → The row/column where excel searches.
return_array → The row/column from which excel returns the result.
if_not_found → optional message if the value is not found.
match_mode → optional setting for search direction/order.

(*) Example: Consider the employee table.

A-ID	B-Name	C-Salary.
101	Priya	25000
102	Rahul	30000
103	Anu	28000

Find the Salary of Employee ID 102.
=XLOOKUP (102, A2:A4, C2:C4, "Not Found").
o/p - 30000.
> 102 is the emp-id we want to find.
> A2:A4 is the range where excel searches for ID 102.
> C2:C4 is the range from where Excel returns salary.
> "Not found" is displayed if the ID doesn't exist.

(*) Advantages Of XLOOKUP :-

- Searches vertically and horizontally.
- Returns values from either the left / right side.
- Uses exact matching by default.
- Can display a custom message when a value is not found.
- Doesn't require a column index number like VLOOKUP.

(*) Disadvantages of XLOOKUP :-

- It doesn't directly support multiple separate, non-contiguous ranges as a single return array.
- The lookup and return arrays must have compatible dimensions.
