* Mastered Custom Sorting : Custom sorting allows us to arrange data based on specific conditions, such as cell color, font color, or cell icons (shapes), instead of sorting only in alphabetical or numerical order.

It helps organize & prioritize data according to its visual formatting, making important information easier to identify.

Example 1: Sorting Based On Cell Colors.

The department column contains cells with different background colors.

> Yellow cells. > Red cells, > No fill cells.

purpose - To group departments or records according to their cell colors.

(*) Steps to Apply Custom Sorting in Excel :-

1. Select your entire data table.
2. Go to Data → Sort → Custom Sort.
3. Select the column you want to Sort.
4. Under Sort On, choose Cell Color, Font Color or Cell Icon.
5. Under Order, select the color or icon and choose where it should appear (on Top or on Bottom).
6. Click Add Level if you want to apply additional sorting conditions.
7. Click OK to apply the sorting.

> Note: Multi-level Sorting allows you to apply multiple sorting rules, while custom sorting based on colors & icons lets you arrange data according to visual formatting. You can combine these options to organize your data more effectively.

## Advanced Filter in Excel :-

It is a feature that allows us to filter data based on specific criteria or multiple conditions. It helps us display only the records that match our requirements without deleting the remaining data.

Unlike a regular filter, Advanced Filter allows us to use a criteria range to apply complex conditions, such as AND and OR conditions, to filter data.

Example : Display North Region OR R&D Department OR Kolkata City Data.
Full Example image is uploaded in GitHub image as "Advance Filtering".

### How to Apply Advanced Filter in Excel :-

1. Create your employee data table with appropriate column headings.
2. Create a separate ~~column~~ Criteria range using the same column headings as your data.
3. Enter the required conditions under the respective headings, ~~as~~ as in the example.
4. Go to the Data tab.
5. Click Advanced in the Sort & Filter group.
6. Select Filter the list, in-place to display matching records in the original table.
7. Select the complete data range in list range

8. Select the criteria table in criteria range.
9. Click OK to display the matching records.

(*) Important Rule :

> Conditions in the Same Row = AND logic.
(all conditions must be satisfied)

> conditions in different Rows = OR logic (Any one condition can be satisfied).
