* **Data Validation**:- It is a feature that controls what type of data a user can enter into a cell. It helps prevent incorrect entries by setting rules such as age limits, phone number length, and PAN card format.

Example: To allow users to enter an age only between 18 and 50.

- Select the cells where you want to enter age.
- Go to Data → Data Validation.
- Under allow, Select "Whole number."
- Under data, Select "between".
- Set minimum : 18
- Set ~~mini~~ maximum : 50.

Examples → 18, 25, 50. ⇒ Valid
17, 51, 60 ⇒ Invalid.

And also can use a "custom" formula if first age is entered in a cell :-

=AND(A2>=18, A2<=50, ISNUMBER(A2)).

★ Text to Columns :- It is an Excel feature used to split the data in a single column into 2 or more separate columns based on a delimiter (such as a space, comma, or hyphen) or a fixed width. It helps us separate combined data into individual parts, making it easier to organize, clean, & analyze data.

Example How to use Text to Columns in Excel :

Step 1 : Select the data.
Select the column containing the combined employee details.

Step 2 : Open Text to Columns.
Go to the "data" tab & click "Text to columns".

Step 3 : Choose the delimiter
Select "Delimited", click Next, & tick Space to split the data wherever a space occurs.

Step 4 : Complete the process.
Choose a destination if needed, then click "Finish" to display the separated data in different columns.

Example :-

Employee Details
8502 Rochitha Shetty
9845 Kiran Kumar

After using Text to Columns:-

Emp ID	First Name	Last Name
8502	Rochitha	Shetty
9845	Kiran	Kumar.

★ Naming Range (Name Manager) in Excel :-

The "Naming Range" option in Excel will allow to assign a meaningful name to a cell or a range of cells instead of using cell references like A2:A17.
The "Name Manager" helps to create, edit, delete and manage these named ranges.

Example :- Naming Employees Name.

Employee Name	Salary
Rochitha	70000
Harshi	80000
Kiran	100000
Suni	74,000
Manya	56,000

Step 1 :- Create a named range.
- Select the employee names in A2:A6.
- Go to the "Formulas tab".
- Click "Define Name" or "Name Manager".
- Enther the name "Names" & Select the appropriate cell reference (A2:A6).
- Click OK.

Now, Named Range : "Names"
Refers to : =Workbook $A$2:$A$6.

Now, we can use:

= COUNTA (Names) – counts the employee names.

= INDEX (Names, 1) – Returns the first employee name, Rochitha.

Naming Range marks formulas easier to read, understand, & manage by replacing cell references with meaningful names.
