Table Creation in Excel :- Table Creation is a feature that converts a normal data range into a Structured table with headers, automatic formatting, filter buttons, & other useful features.
It helps us to organize, manage, analyze, & filter data easily.

(*) Steps to Create a Table :-

1. Enter the data ⇒ Enter the employee details in excel, including column headings.
2. Select the data ⇒ Select the entire data range, including the column headings.
3. Go to the insert tab ⇒ click Insert → Table.
4. Confirm the range ⇒ Check whether the selected range is correct.
5. Select the header option ⇒ Tick My table has headers.
6. Click OK ⇒ Excel converts the selected data into a formatted table.
7. Choose a table style ⇒ Go to the Table design Tab & select a style if required.

(*) Shortcut ⇒ Select your data & press "Ctrl+T" to create a table quickly.

(*) Advantages of Table Creation :-

> Organizes data in a Structured format.
> Adds filter & sorting options to column headings.
> Automatically expands when you add data directly below the table.
> Makes data analysis easier.

> Provides options for applying table styles & formatting.

(*) Difference between Normal Data Range V/s Structured Table in Excel :-

1. Normal Data Range ⇒
- A collection of data stored in regular Excel cells.
- Formatting & formulas may need to be applied or copied manually.
- New rows may require updating formulas & chart ranges.
- Filters must be enabled separately when needed.
- Suitable for simple datasets that don't change frequently.

(✗ Normal → more Manual management
Table → built-in features)

2. Structured Table ⇒
- A data range converted into a Excel table using Ctrl + T.
- Provides built-in sorting & filtering.
- Automatically ~~expands~~ extends formatting & Calculated-column formulas in common cases.
- Expands to include new rows, helping table-based formulas update automatically.
- Supports structured references, such as =SUM(EmployeeTable[Salary]).
- Supports slicers for interactive filtering.
- Ideal for growing datasets, data analysis & dashboards.

* Slicer in ~~Excel~~ Excel :- A Slicer is a visual filtering tool in Excel that allows users to filter table or Pivot Table data by clicking buttons representing specific values.

Unlike the normal filter dropdown, a Slicer displays the available categories as clickable buttons, making filtering easier & more interactive.

(*) Steps to Insert Slicer in Excel :-

1. Select the table ⇒ Click any cell inside the ~~exact~~ excel table.
2. Open the table Design tab ⇒ Click Table Design on the ribbon.
3. Click Insert Slicer ⇒ Find & Select the Insert Slicer option.
4. A dailog box appears with the available column names.
5. Tick the checkbox beside ~~check~~ Department.
6. Excel creates a slicer with buttons for the available departments.
7. Click a department button, such as Training, to display only the matching employee records

(*) Note : You can select multiple departments in a Slicer by holding ctrl while clicking the required buttons.
Use the Clear Filter button on the Slicer to remove the selection & show all records again.

(*) Advantages Of Slicers :-

> Makes filtering data Quick & easy.
> Provides a visual & interactive filtering experience.
> Clearly shows which filter is selected.
> Allows users to filter data by clicking buttons.
> Helps users explore & analyze large datasets efficiently.

(*) Difference between Filter & Slicer :-

Filter	Slicer
> Dropdown menu in the column header.	> Separate box with clickable buttons.
> Select values from a dropdown list.	> Click buttons to filter data.
> Selected filters may be less obvious.	> Selected values are visually highlighted.
> Requires opening a dropdown.	> Allows direct clicking.
> Excel tables & other supported data ranges.	> Excel tables & PivotTables.
